R;Murray, J.; Wohldmann, P.; Bauer, C.; Biewald, T.
submitted to the EMBL Data Library, September 1997
A;Description: The sequence of C. elegans cosmid T03D3.
A;Reference number: 221136
A;Accession: T32207
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: DNA
A;Residues: 1-374 <MUR>
                                                                                                                                                                                                                                               hypothetical protein 73 - red alga (Chondrus crispus) mitochondrion C;Species: mitochondrion Chondrus crispus (carragheen) C;Date: 24-Jul-1998 #sequence_revision 24-Jul-1998 #text_change 21-Jul-2000 C;Accession: S59082

-1 CATALYTIC ACTIVITY: D-galactosyl-N-acylsphingosine + H(2)O = D-galactose + N-acylsphingosine.

-1 SUBCELLULAR LOCATION: Lysosomal (By similarity).

-1 DISEASE: DEFECTS IN GALC ARE THE CAUSE OF GLOBOID CELL LEUKODYSTROPHY (GLD). THIS DEFICIENCY RESULTS IN THE INSUFFICIENT CATABOLISM OF SEVERAL GALACTOLIPIDS THAT ARE IMPORTANT IN THE PRODUCTION OF NORMAL WITELIN.

-1 SIMILARITY: BELONGS TO FAMILY 59 OF GLXCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                           MEDLINE-96299640; PubMed-8661004;

"Analysis of F factor TraD membrane topology by use of gene fusions and trypsin-sensitive insertions.";
J. Bacteriol. 181:6108-6113(1999).
-!-FUNCTION: TRAD IS A CELL ENVELOBE PROTEIN. THE FUNCTION OF TRAD IS UNKNOWN BUT IT IS ESSENTIAL FOR DNA TRANSFER. IT MAY FORM OR MAY BE PART OF A NON-SPECIFIC PORE FOR DNA EXPORT, OR IT MAY DIRECTLY ENERGIZES DNA TRANSPORT.
-!- SUBCELLULAR LOCATION: Integral membrane.
-!- SIMILARITY: TO THE TRAD OF PLASMID INCFII R100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Jalajakumari M.B., Guidolin A., Buhj H.J., Manning P.A.; "Surface exclusion genes tras and traT of the F sex factor of Escherichia coli K-12. Determination of the nucleotide sequence and promoter and terminator activities."; J. Mol. Biol. 198:1-11(1987).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

This invention relates to a peptide fragment of a cellular form of prion protein PrPc located around a disulphide bond found in PrPc. The stable structure is a specific marker of PrPc but not soluble prion protein (PrPsC). The PrPc peptide sequences can be used to generate an antibody or binding agent that binds PrPc. The antibody is used to detect or remove PrPc, and may be used in preventative medicine. The antibody may be used in the prevention, treatment or diagnosis of a prion disease, e.g. spongiform encephalopathies, such as Scraple in sheep, bovine spongiform encephalopathies (BSE) in cows, and Creutzfeldt Jakob disease (CJD) in humans. The present sequence represents the cellular form of marsupial prion protein, the stable region of the protein may be used in the production of anti-PrPc antibodies.
                 New prion peptide for treating, preventing and/or diagnosing prion diseases e.g. scrapie in sheep, bovine spongiform encephalopathies in cows and Creutzfeldt-Jakob disease in humans .

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activitiess such as: cytostatic; hepatoricopic; vulnerary; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunosimilant; cardiant; thrombolytic; coaquiant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; antidiabetic antidiametory; antidiapetic or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic caneenia, bunch and cartilage damage, nocturnal haemoglobinuria, antiinfilammatory disease; to enhance companies and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cells they are expressed in, such as: antibilianmatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HTV; fungicide; antirheumatic; cardiovascular; antianaemic; antiagaregant; haemostatic; vulnerary; cardiovascular; antianaemic; antiagaregant; haemostatic; vulnerary; antidioter; osteopathic; dermatological; antiallergic; antiasthmatic; cardiovascular; and immunostimulant. The proteins and polynucleotides antigabletic; cytostatic; neuroprotective; antidepressant; nootropic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides are useful for screening for sproduction, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, enuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhinitis, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, parkinson's disease, neurodegenerative and concernance and concernan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ή
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antirheumatic; antiathritic; antiinflammatory; antiallergic; osteopathic; antipsoriatic; antiarteriosclerotic; antiasthmatic; immunosupressive;

This sequence represents a novel STE20-related protein kinase. The invention relates to nucleic acid molecule encoding a kinase polypeptide selected from STIAK2, STLK4, STLK5, STLK6, STLK7, ZC1, ZC2, ZC3, ZC4, KHS2, SULU1; SULU3, GEK2, PAK4 and PAK5. The proteins are used to identify agonists and antagonists, and to raise antibodies. The polynucleotides are useful in gene therapy protocols. The polynucleotides, antibodies, antagonists and agonists may be used to treat diseases such as immune-related disorders and discases (e.g. rheumatoid arthritis, artherosclerosis, chronic inflammatory bowel disease (e.g. crohn's disease), asthma, osteoarthritis, psoriasis, atherosclerosis, chronic inflammatory pelvic disease, multiple sclerosis, organ transplantation, chronic inflammatory pelvic disease, multiple sclerosis, stroke, renal failure, oxidative infarction, cardiovascular disease, stroke, renal failure, oxidative sclerosis, parkinson's disease and Leigh syndrome), cancer, cardiomyopathies, ischemic disorders, inflammatory disorders, diabetes mellitus, fibrotic and mesangial disorders. The proteins may also be useful for cell yrowth regulation (e.g. in wound healing), T cell activation, mitosis control, and as immunosuppressants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ij

Rat TAO1 kinase. 27-JAN-2000

(first entry)

p38; protein kinase; cancer; inflammation; autoimmune disease; degeneration; insulin-resistant diabetes; metabolic disorder; neurodegeneration; MAP kinase; MAP/ERK kinase.

```
This sequence represents a consensus peptide sequence conained in novel
STE20-related protein kinases. The invention relates to a nucleic acid
molecule encoding a kinase polypeptide selected from STLK1, STLK3, STLK4,

```
The present sequence represents rat TAO1 protein kinase, which is capable of phosphorylating MEK3 (a MAP/ERK kinase). TAO kinases, and related polypeptides, are used to screen for modulators of stress-responsive mitogen activated protein (MAP) kinase pathways. These modulators are potentially useful for treating or preventing: (1) inflammation, autoimmune disease, cancer and degeneration (inhibitors of) phosphorylation); or (2) insulin-resistant diabetes, metabolic disorders and neurodegeneration (enhancers of phosphorylation). TAO kinases are also used to raise specific antibodies, useful therapeutically as modulators and as immunoassay reagents for detecting TAO kinases. TAO kinase polynucleotides can be used: (a) for recombinant expression of TAO kinases and (b) in the form of fragments, for detecting TAO kinase polynucleotides in standard hybridisation and amplification tests. TAO kinases are highly specific for MEK3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; CNS; peripheral nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; hamemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic;

                                                                                                                                                                                                                                                                                                                                               the encoded polypeptides (AAAA21313) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful immunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and coalised neuropathies and central nervous system diseases, such as a Alzhaimer's, Parkinson's disease, Huntington's disease, samyotrophic utilisation of the activities such as: Immune system suppression, Activitionibin activity, chemoteactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed

which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiposoriatic; antiposoriatic; neuroprotective; conceptable; antiposoriatic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaqulant; vasotropic; antidabetic; hypotensive; dermatological; immunosuppressive; antidabetic; hypotensive; dermatological; immunosuppressive; antidabetic; hypotensive; dermatological; antihungal; antirheumatic; antithyzoid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating to action be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, cocurral haemoglobinizia, antinflammatory disease; to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activity/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       assays for receptor activity, transfer of the printed Note: The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                             (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Novel secreted factor encoded by clone P00188D12 which is differentially expressed in certain disease states, useful in diagnosing and treating cardiac, renal or inflammatory diseases

Claim 1; Fig 1; 71pp; English.

The patent discloses novel secreted factor protein encoded by clone p00188_D12. The secreted factor is differentially expressed in certain disease states. Secreted protein, its antibodies, antigonists or compositions comprising them are useful in the diagnosis and treatment of cardiac diseases such as congestive heart failure, myocarditis, hybritopiac cardianypathy, angina pectoris, myocardial infarction, cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal failure, renal glucosuria, renal infarction, nephrogenic diabetes insiphdus, polycystic kidney diseases, hereditary nephritis and inflammatory diseases such as asthma, autoimmune diabetes, toxic shock angiogenesis, rheumatoid arthritis, osteoarthritis, toxic shock syndrome, astroke, neural trauma, psoridasis, cerebral malaria, osteoporosis, Crohn's disease, ulcerative colitis, Alzheimer's disease. Secreted protein DNA is useful in antisense-mediated gene inhibition and in gene therapy. An array comprising one or more oligonucleotides complementary to reference RNA or DNA encoding the secreted factor is useful for detecting cardiac, kidney and inflammatory disease.
